Dear Sir/Madam,

## **Single-use plastic items: Consultation Regulatory Impact Statement**

Thank you for the opportunity to comment on the Consultation Regulatory Impact Statement for the proposed ban on certain single-use plastic items.

The Environmental Defenders Office is a community legal centre specialising in public interest environmental law. We have a long history of involvement in waste laws at the Commonwealth and state level.

We commend the Queensland government for its continuing action to reduce plastic pollution and support the proposed ban on certain problematic and unnecessary plastics. However, we note that this is only a small step in addressing what is a large and complex problem.

### **Executive summary**

Our response to the following questions asked in the Consultation Regulatory Impact Statement<sup>1</sup> (**RIS**) can be summarised as follows:

- In relation to question 1, we **recommend** that stage 1 of the ban be expanded to also include balloon sticks and that stage 2 of the ban include beverage container lids, wet wipes and plastic cotton buds. We further **recommend** that the government commit publicly to a timeframe to introduce stage 2.
- In relation to question 3, we do not support an exemption for 'shelf-ready' packaged products, nor do we believe that such products should be treated as a single category. There may be a case for delayed implementation of the ban for products only where the plastic item is an inherent part of the way in which the product is opened and consumed (to allow for re-design of the packaging) (eg. juice boxes).

---

<sup>1</sup> Single-use Plastic Items – Consultation Regulatory Impact Statement, found at: <https://www.qld.gov.au/environment/pollution/management/waste/recovery/reduction/plastic-pollution/reducing-plastic/business>

- In relation to question 5, In our view option 2 (the proposed regulatory ban) is the only option which is likely to be effective and consistent both with the polluter pays principle and the waste hierarchy. The other options considered in the RIS are unlikely to be effective and are inconsistent with both the polluter pays principle and the waste hierarchy.
- In relation to question 6, while we believe that public awareness campaigns could supplement regulatory measures (such as the proposed ban), they should not be viewed as a substitute for the proposed ban.

### **Detailed discussion**

#### **Question 1: support for the ban**

We commend the Queensland government on the proposed ban, which we support.

While we acknowledge that reducing plastic pollution is a staged process, which involves both regulatory and non-regulatory interventions, there do seem to be some products that have not been addressed under either existing initiatives or under either stage one or two of the proposed ban.

In particular, we believe that there has yet to be adequate action on:

- Beverage container lids, which are a significant source of ocean plastics not addressed under the existing container refund scheme. This source of waste could be addressed through design of beverage containers to have attached lids with an associated ban of untethered lids;
- Wet wipes, which are a single use item that frequently contains plastic;
- Cotton buds with plastic stems, which can be banned and replaced with cardboard stems (with appropriate exceptions for medical uses);
- Balloon sticks, which are included in the European Union directive banning single use plastics and would seem to be an easily eliminated source of waste. It is not at all clear why they have been left to stage 2 of the ban (which appears to consist of single use plastics that are somewhat more difficult to replace).

In that regard, we **recommend** that stage 1 of the ban be expanded to include balloon sticks and that stage 2 of the ban include beverage container lids, wet wipes and plastic cotton buds.

We further support stage 2 of the ban and **recommend** that the government commit publicly to a timeframe to introduce stage 2. This would not only give the community confidence that the Queensland government is serious about eliminating problematic and unnecessary plastics but would give business additional time to identify substitutes.

#### **Question 2: Exemption for shelf-ready products**

We do not support an exemption for shelf-ready products, however, in some cases allowing a delayed implementation of the ban may be necessary to provide businesses with additional time to re-design the product.

Treating 'shelf-ready' products as a single, homogenous category is perhaps somewhat misleading. The examples used in the RIS are juice boxes (in respect of which the straws are an

inherent part of how the packaging is opened and the product consumed) and ready to eat tuna salad with an included fork (where the fork can be easily substituted for non-disposable cutlery). While there may be some justification for a delay in implementing the ban for juice boxes, that reasoning does not apply to other 'shelf-ready products'.

We **recommend** that the proposed ban include shelf-ready products, with a delayed commencement only for those products where the single-use plastic item is a component needed to both open and consume the product, that cannot be substituted for a non-disposable alternative (such as metal cutlery).

### **Question 5: Positive and negative impacts of identified options**

The identified options are:

- Option 1: Maintain the status quo
- Option 2: A legislated ban on the supply of single-use plastic straws, stirrers, plates and cutlery;
- Option 3: Implement non-regulated approaches, including greater education and awareness
- Option 4: Install additional collection and clean up infrastructure, such as bins, stormwater interception devices and gross pollutant traps.

In our view, the key considerations for assessing the relative merits of these options should be:

- Effectiveness;
- Consistency with the polluter pays principle<sup>2</sup> which seeks to internalise (to the polluter) costs that would otherwise be externalised (ie. transferred to society as a whole, in the form of plastic pollution in this case); and
- Consistency with the waste hierarchy,<sup>3</sup> which places the highest priority on waste avoidance.

#### Option 1: status quo

Option 1 is likely to see Queensland continue on a trajectory of increasing use of single use plastics, with consequent impacts for ocean plastics and our biodiversity.

#### Option 2: Proposed ban

In our view, proposed option 2 (a regulatory ban on the identified single use plastics) is the only potentially viable option of the four discussed in the RIS.

The RIS presents early evidence of reductions in litter resulting from the current plastic bag ban and container refund scheme. This evidence demonstrates that regulatory bans, such as the

---

<sup>2</sup> The polluter pays principle is a key principle of the *Waste Reduction and Recycling Act 2011 (Qld)* (see ss4 and 10). In the Act, the polluter pays principle is defined as the principle that all costs associated with the management of waste should be borne by the persons who generated the waste.

<sup>3</sup> The waste and resource management hierarchy is a key principle of the *Waste Reduction and Recycling Act 2011 (Qld)* (see ss4 and 9) and the foundation of Queensland's current waste policy (*Waste Management and Resource Recovery Strategy*, found at:

<https://www.qld.gov.au/environment/pollution/management/waste/recovery/strategy>)

proposed ban, can be an effective tool for reducing pollution of problematic and unnecessary plastics.

This option will avoid the creation of unnecessary waste and will not see the costs of cleaning up unnecessary plastic transferred onto the community. It is therefore consistent with both the polluter pays principle and the waste hierarchy.

The RIS unfortunately understates the environmental benefits of this option (and similarly understates the disadvantages of the other options) by limiting the description of community benefits to “a reduction in littering”, without including a more detailed discussion of benefits such as:

- reducing the plastic load in our local marine environment (given that the significant quantities of plastic debris in our oceans are largely locally generated<sup>4</sup>);
- avoiding the harm that ocean plastics can cause to marine life through ingestion, suffocation and entanglement;
- reducing the transport of invasive species and concentration of toxic pollutants;<sup>5</sup>
- avoiding the further impacts that are likely to emerge as we learn more about the impacts of microplastics and nanoplastics;<sup>6</sup>
- reducing the fossil fuel emissions released by plastic production.<sup>7</sup>

While these benefits may be difficult to quantify, the RIS guidelines allow such benefits to be described qualitatively.<sup>8</sup>

#### Option 3: Education and awareness campaign

Option 3 would essentially involve placing the responsibility for solving a systemic problem onto individuals, without attempting to avoid the creation of the waste.

In our view, it is not reasonable to expect all consumers to, with sufficient education, make environmentally positive choices within a system that provides environmentally damaging choices as the most convenient (and often only) option.

As a consequence, we think that this option is unlikely to be effective. It is also inconsistent with both the polluter pays principle and the waste hierarchy.

#### Option 4: Additional bins, stormwater interception devices and gross pollutant traps

Option 4 could be described as an end-of-pipe solution, which is out of step with modern environmental regulation. It is similarly inconsistent with both the waste hierarchy and the polluter pays principle.

**Question 6: More voluntary action, such as educational campaigns on the impacts of single-use plastics**

There appears to be some evidence that well-designed educational campaigns can be effective to some degree. However, in order to be effective, such campaigns must create behaviour change across a much larger number of entities than is the case for a simple ban. Further, despite quite a long history of public anti-littering campaigns in this country, there are increasing amounts of plastic waste entering our oceans.

As a consequence, while we believe that public awareness campaigns could supplement regulatory measures (such as the proposed ban), they should not be viewed as a substitute for regulatory measures.

If you have any queries, please don't hesitate to contact Deborah Brennan (dbrennan@edoqld.org.au).

Yours sincerely,

**Environmental Defenders Office**
